Chen Y, Gout I; Stockert E, Gure A, Cher Pfreundschuh M, Tureci O, Scanlan MJ, Obata Y, WPI; 1999-132448/11. New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers.

Example 8; Page 787; 787pp; English.

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically

binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                             9

disturbances. The products of the invention have vulnerary, antitumour, gastrointestinal, dermatological, anti-inflammatory and antiuloer activity. The NM23 procein family act as nucleotide-diphosphate kinases, DNA-binding and transcription activating agents and regulators of Ras-GTPases. The proteins of the invention, antibodies (Ab) directed against them, and their encoding nucleic acids, or related vectors, transformed cells and antisense sequences, are used for analysis, diagnosis, prevention and/or treatment of skin and intestinal diseases (where associated with uncontrolled tissue growth or cell differentiation, particularly skin and intestinal tumours, also psoriasis, Crohn's disease and ulcers), wound healing and/or associated pathological alterations).

They are also used to screen for agents that are potentially useful for treating these conditions. In vitro monitoring of NM23 protein expression in tissue samples provides an early diagnosis of disease. This sequence in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human NM23 protein, useful for diagnosis and prognosis of cancer, and assessment of aggressiveness and susceptibility.

antibody and reagent

polynucleotides, polypeptides, antisense molecule, antibody and reagent are useful for preparing compositions for preventing, predicting or diagnosing, or a medicament for treating a cardiovascular disease, e.g. arteriosclerosis, ischaemia, angina pectoris, or myocardial infarction. This sequence represents a protein identified in the invention a being differentially expressed in individuals with cardiovascular disease

                    H1 and H2S. These proteins are products of different genes, with NM23-H1 being localised to chromosome 17. These proteins are used to predict aggressiveness (metastatic potential) of human tumours and in genetic tests for cancer susceptibility, diagnosis and prognosis, also for selection of treatment, e.g. susceptibility to early-onset familial breast cancer. Gene nm23 may contribute to tumourigenicity and alteration in its regulation may be an early stage in the metastatic cascade. Allelic or homozygous deletion of the gene is detected in some primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a method of predicting, diagnosing or prognosing a cardiovascular disease by detection of a polymuclectide in a biological sample comprises hybridiaing at least one of the polymuclectide to a nucleic acid material of a biological sample, thus forming a hybridisation complex, and detecting the hybridisation complex. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 FPGLVKYMNSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDFCIQVGRNIIHGS 120

coverent in carrier transfer to disposate and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and polypeptides; expression vectors and host cells comprising a TAT nucleic acids an antibody specific for TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, anteagonists, binding molecules and compositions are useful antibodies, anteagonists, binding molecules and compositions are useful increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, carvical cancer, such as breast cancer, colorectal cancer, cervical cancer, inver cancers bladder cancer, cervical cancer, inver cancers, bladder cancer, cervical cancer, cancers of the central nervous system, melanoma and leukamia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in the inventors of the cancer and in gene therapy. The present sequence

                                                                                                                                      The invention relates to a novel isolated nuclear axid and the PRO coleopathic, antidatheric, anticheumatic, immunosuppressive, antidiflammatory, antidatheric, anticheumatic, immunosuppressive, costeopathic, antidatheric, and respiratory activity. A polynucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its antidatheric, hepatotropic, and respiratory activity. A polynucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its agonist, or antibody that specifically binds to the polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, inventic chronic arthritis, a spondyloarthropathy, systemic selerosis, an idiopathic inflammatory myopathy, Sigern's syndrome, systemic sclerosis, autoimmune hemolytic anaemia, autoimmune therapy in the peripheral nervous disease, a demyelinating disease of the central or peripheral nervous system, idiopathic demyelinating polyneuropathy, Gulliain-Barre syndrome, a chronic inflammatory demyelinating polyneuropathy, dulliain-Barre syndrome, confisease, infectious or autoimmune chronic active hepatitis, sclerosing cholangitis, inflammatory bowel disease, gluten-sensitive enteropathy, Mhipple's colisease, an autoimmune or immune-mediated skin disease, abullous skin disease, an autoimmune or immune-mediated skin disease, abullous skin disease, archne, allergic rhinitis, atopic dermatitis, poor an allergic rhinitis, atopic dermatitis, poor an allergic chronic phenomonia, idiopathic pulmonary fibrosis, graft rejection or contact dermatitis, dransplantation associated disease, graft rejection or graft-versus-host disease. The present sequence represents a PRO protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

whether a mammal will respond or increase that control in the comprises measuring the level of one or more biomarkers selected from 2774 biomarkers given in the specification (nucleotide sequence SEQ ID NO:1246 (Genbank EST W28729) is especially preferred). The method of the invention is utilized in a kit for determining or predicting whether patient would be susceptible or resistant to treatment by an agent modulating odk activity. The invention also describes a method for utilizing individualized genetic profiles for treating diseases and disorders based on patient's response and molecular level, specialized microarrays comprising the biomarkers described, antibodies directed against the biomarkers and a cell culture model to identify biomarkers.

The cdk modulator is preferably N-5-[[5-(1,1-1)imethylethyl]-2-oxazolyy]methyllthol-2-thiazolyl-4-piperidine carboxamide, 0.5-Lutratic acid salt. Note: The sequence data for this patent did not form the printed specification, but was obtained in electronic format directly from WIDO at ftp. wipo.intt/pub/published_pct sequences. This sequence represents a biomarker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 FPGLVKYMNSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDFCIQVGRNIIHGS 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of inhibitors of human-PRUNE cyclic nucleotide phosphodiesterase for preparation of medicament in the treatment of tumor metastases associated with overexpression of human-PRUNE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 FPGLVKYMNSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDFCIQVGRNIIHGS 120
                                                                                                                                                        The invention relates to an isolated nucleic acid encoding a PRO polypeptide. The polypeptide, agonist or an antagonist, antibody, composition, and method are useful for diagnosing and treating an immune related disorder, e.g. systemic lupus erythematosus, rheumatoid arthritis. The present sequence represents a PRO polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                         New nucleic acid encoding PRO polypeptide, useful for diagnosing and treating an immune related disorder, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, thyroiditis, or diabetes mellitus

development of compounds with a cytostatic activity acting as human-PRUNE overexpression inhibitors. The invention is useful for preparation of medicaments in the treatment of tumor metastases, for example breast carcinoma, sarcoma, neuroblastoma, prostate tumor, pancreatic tumor, colonic tumor, rectal tumor, medulloblastoma, epitelioma, epatocarcinoma, cell T or cell B lymphomas, myeloma and melanoma and pulmonary tumor. As the h-PRUNE posses cyclic nucleotide phosphodissterase activity with preferential activity for camp over ceMP, the h-PRUNE overexpression can be effectively suppressed by certain PDE inhibitors thus the PDE inhibitors provides an effective alternative therapy for camp or the heavel of the development of the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FPGLVKYMNSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDFCIQVGRNIIHGS 120

Claim 1; Fig 6; 21pp; English

```
The invention relates to an isolated polynucleotide molecule encoding a human nm3 protein comprising nm23-HI having a sequence of 746 base pairs (bp) fully defined in the specification or nm23-H26 having a sequence of 670 bp fully defined in the specification. The polynucleotide molecule of the invention is useful as a diagnostic tool for detecting and/or determining RNA or DNA which can be employed to detect mRNA expression in cancer cells to aid in predicting the malignant potential of a human tumour. The DNA and the antibodies may also be used to detect
                                                                                                                                                                                                                                                 ö
The present sequence is the human nm23 protein nm23-H2S. Its coding sequence was isolated by searching a human lung cDNA library for sequences similar to pnm23-H2. Nm23 proteins are involved in tumour metastasis, and this protein, its gene and antibodies can be used to determine an individual's susceptibility to cancer and the likelihood of tumour metastasis within that individual. This is spossible using a number of methods, including Northern blotting, nuclease protection assays, in situ hybridisation, immunohistochemical analysis and solid phase
                                                                                                                                                                                                                                                                                                                                                   61 FPGLVKYMNSGPVVAMVWEGLAVVKTGRVMLGETNPADSKPGTIRGDFCIQVGRNIIHGS 120
                                                                                                                                                                                                                                                                                                                                                                         New DNA molecule encoding a human nm23 protein useful for predicting the malignant potential of a tumor and the genetic predisposition for developing cancer, comprises nm23-H1 and nm23-H2s genes.
                                                                                                                                                                                                                                                                                                                   84

These proteins are products of different genes, with NW23-H1 being localised to chromosome 17. These proteins are used to predict aggressiveness (metastatic potential) of human tumours and in genetic tests for cancer susceptibility, diagnosis and prognosis, also for tests for cancer. Seatment, e.g. susceptibility to early-onset familial breast cancer. Gene nm23 may contribute to tumourigenicity and alteration in its regulation may be an early stage in the metastatic cascade.
genetic predisposition for developing cancer. The human mm23 protein can be employed to produce nm23 antibodies. This sequence represents the nm23-H2S protein of the invention

The present sequence is the human nucleoside diphosphate kinase protein. This sequence is the autoantigen identified from cell lines using sera of patients with liver cirrhosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Fatent No. US20020068288A1

GENERAL INFORMATION:

APPLICANT: Lodes, Michael J.

APPLICANT: Secrist, Heather

APPLICANT: Mohamath, Raddoh

APPLICANT: Mohamath, Raddoh

APPLICANT: Fan, Ligun

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY

TITLE OF INVENTION: AND DIAGNOSIS OF LUNG CANCER

FILE REFERENCE: 210121.512

CURRENT APPLICATION NUMBER: US/09/833,790

CURRENT PILING DATE: 2001-04-11

NUMBER OF SEQ ID NOS: 4400

SOFTWARE: FastSEQ for Windows Version 4.0
APPLICANT: Edgerton, Michael D
TITLE OF INVENTION: TRANSGENIC PLANTS WITH IMPROVED PHENOTYPES
FILE REFERENCE 38-15(52796) C
CURRENT APPLICATION NUMBER: US/10/732,923
CURRENT FILING DATE: 2003-12-10
PRIOR PEDFLICATION NUMBER: 10/310,154

Sequence 5, Application US/09335948

Patent No. 6329198

GENERAL INFORMATION:
PAPPLICANT: National Institutes of Health
APPLICANT: Charles R. King
APPLICANT: Lance A. Liotta
TITLE OF INVENTION: PRODUCTION AND USE OF HUMAN NM23 PROTEIN
TITLE OF INVENTION: PRODUCTION AND ANTIBODIES THEREFOR
TITLE OF INVENTION: PRODUCTION AND ANTIBODIES THEREFOR
TITLE OF INVENTION NUMBER: US/09/335,948
CURRENT FILING DATE: 1999-06-18
PRIOR PRILING DATE: 1999-06-18
PRIOR PRILING DATE: 1999-06-18
PRIOR PLILING DATE: 1999-06-17
PRIOR APPLICATION NUMBER: 07/806,932
PRIOR FILING DATE: 1999-112-11
PRIOR APPLICATION NUMBER: 07/422,801
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

"X-ray structure of human nucleoside diphosphate kinase B complexed
with GDP at 2-A resolution.";

Structure 3:1307-1314(1995).

- :- FUNCTION: Major role in the synthesis of nucleoside triphosphates
other than APP.

- :- FUNCTION: Acts as a transcriptional activator of the c-Myc gene;
binds DNA nonspecifically (Ref. 3).

- :- CATALYTIC ACTIVITY: APP + nucleoside diphosphate = ADP +
nucleoside triphosphate.

- :- COFACTOR: Magoresium (By similarity).

- :- SUBURIT: Hexamer of two different chains: A and B (A6, A5B, A4B2,
A3B3, A2B4, AB5, B6).

- :- SUBCLIULAR LOCATION: Nuclear and cytoplasmic.
